**Session 4: Global Economic Cooperation and Key Takeaways**

**Background:**
The pace of AI development is narrowing the window for policymakers to mitigate risks and ensure that its gains are broadly shared. Because the effects of AI and the consequences of national policy choices will extend across borders, effective responses will require cooperation even as geopolitical divisions deepen. This session will take stock of the day's discussions and identify priorities for policy, research, and international coordination.

**Lead speakers:**

Mohammed Al-Jadaan, Minister of Finance of the Kingdom of Saudi Arabia

Kenneth Rogoff, Maurits C. Boas Professor of Economics, Harvard University; former Chief Economist of the IMF

**Focus:** The session will synthesize the day's discussions around:

- Areas for action and knowledge gaps that limit policymakers' ability to anticipate the economic consequences of AI.
- Policy options for addressing the cross-border effects of AI, including its implications for trade, investment, financial stability, privacy, and systemic risk.
- Avenues for global economic cooperation, including the roles of multilateral institutions, academic research, and emerging and middle powers.
- Practical priorities for future dialogue and coordination amid geopolitical competition.

**Outcomes:** (1) A framework for situating the day's discussions within the broader context of international competition and multilateral cooperation. (2) An understanding of where further research, policymaking, and cross-sectoral collaboration are most needed. (3) A set of priorities for future dialogue and next steps for participants.
